

Complete the fields that apply to your app. Use Not applicable when needed.

Save the PDF after entering answers. Longer answers may scroll inside their fields.

Prepared for

Project owner

Date / version

1. Project Foundation

Fill in each response

App or project name

Describe the app in one sentence

What problem does the app solve?

Who experiences this problem?

What is the primary outcome the app must deliver?

What type of app is it? (web, mobile, desktop, internal tool, marketplace, etc.)

What is included in version one?

What is explicitly out of scope for version one?

2. Target Users and Roles

Fill in each response

Who are the primary users?

Who are the secondary users?

List every user role

What can each role view, create, edit, approve, delete, or export?

Are there age, location, membership, employment, or eligibility restrictions?

What accessibility or language needs should be supported?

3. User Journey and Workflows

Fill in each response

Describe the first-time user journey from opening the app to completing the first valuable action

Describe the returning-user journey

What are the three most important tasks users must complete?

For each key task, list the exact steps, decisions, confirmations, and possible failures

What should happen when a task is abandoned or interrupted?

Must-have features for launch

Should-have features

Nice-to-have features

Future features

For each must-have feature, describe who uses it, required inputs, expected output, permissions, and errors

5. Screens, Navigation, and Layout

Fill in each response

List every public screen

List every signed-in user screen

List every staff or administrator screen

What is the primary navigation structure?

Which pages require authentication or a specific role?

What should each dashboard show first?

What should mobile navigation look like?

6. Visual Design and Branding

Fill in each response

Describe the desired visual style using specific words

Primary, secondary, accent, background, and text colors

Preferred fonts or typography style

Button, card, icon, image, and animation preferences

Apps or websites to use as visual references, and what to borrow from each

Design elements, colors, or styles to avoid

Should the app support light mode, dark mode, or both?

7. Accounts, Profiles, and Authentication

Fill in each response

How can users register and sign in?

What information is required during registration?

Is verification, approval, invitation, or identity checking required?

What can users edit on their profile?

What profile information is public, private, or role-restricted?

How do password reset, account recovery, account deletion, and data export work?

Is two-factor authentication required or optional?

8. Forms, Data, and Validation

Fill in each response

List every form the app needs

For each form, list fields, field types, required fields, limits, and validation rules

What records or database objects must exist?

How are the records related?

Who can create, view, edit, archive, or delete each record?

What duplicate-prevention or data-quality rules are needed?

9. Search, Filters, Sorting, and Discovery

Fill in each response

What can users search for?

What filters are required?

What sorting options are required?

Should search include autocomplete, typo tolerance, recent searches, or recommendations?

What should appear when there are no results?

10. Content and File Management

Fill in each response

What content can be created, uploaded, published, scheduled, or archived?

Who can create, approve, edit, feature, reject, or remove content?

What file types, sizes, dimensions, or duration limits apply?

Should uploads include previews, progress, compression, replacement, or version history?

Where should media be stored and how should access be controlled?

11. Payments, Subscriptions, or Transactions

Fill in each response

Does the app accept money or process transactions? Describe each transaction type

What products, plans, prices, fees, taxes, discounts, or trials exist?

Which payment provider should be used?

How do receipts, refunds, cancellations, disputes, failed payments, and renewals work?

Does the app pay vendors, creators, or service providers? Describe payout rules

12. Scheduling, Location, and Communication

Fill in each response

Does the app include appointments, reservations, events, availability, or calendars?

Describe booking, cancellation, rescheduling, capacity, and reminder rules

Does the app use maps, addresses, current location, directions, delivery, or service areas?

Does the app include direct messages, group chat, comments, calls, or support chat?

Who may contact whom, and what blocking or reporting controls are required?

13. Notifications and Automations

Fill in each response

List every event that should trigger an in-app, email, SMS, push, or browser notification

Can users control notification channels and frequency?

List automatic actions the system should perform

For each automation, define trigger, conditions, action, timing, retries, and failure handling

14. Administration, Moderation, and Reporting

Fill in each response

What metrics should appear on the administrator dashboard?

What user-management actions should administrators have?

What content, transaction, configuration, and integration controls should administrators have?

What can users report, and how does the moderation workflow operate?

What audit logs and exportable reports are required?

15. Integrations and AI Features

Fill in each response

List every external service or API the app must connect to

For each integration, describe information sent, information received, permissions, and failure behavior

What AI features should be included?

What information may the AI access, and what must remain private?

What should the AI refuse, label, verify, or escalate?

What happens when an AI or external service is unavailable?

16. Security, Privacy, and Compliance

Fill in each response

What personal, financial, health, identity, location, or private information is stored?

Who may access sensitive information?

What retention, deletion, consent, and data-export rules apply?

What legal policies or industry rules apply?

What security controls are required?

What rate limits, session rules, audit logs, and suspicious-activity controls are needed?

17. States, Errors, and Edge Cases

Fill in each response

Describe loading states for major screens and actions

Describe empty states for dashboards, searches, messages, orders, or content

Describe success confirmations for important actions

List likely errors and the exact user-friendly recovery behavior

What happens with slow internet, offline use, duplicate submissions, expired sessions, and unavailable services?

18. Technical and Performance Requirements

Fill in each response

Preferred frontend, backend, database, hosting, and authentication technologies

Expected launch users, simultaneous users, storage volume, and growth

Performance targets for loading, search, uploads, and key actions

Which devices, browsers, screen sizes, and operating systems must be supported?

Are offline support, real-time updates, background jobs, or native device features required?

19. Testing and Acceptance

Fill in each response

List test accounts and roles that should be created

What functional, permission, security, mobile, browser, accessibility, and integration tests are required?

Write clear acceptance criteria for each must-have feature

What exact conditions define version one as complete?

What known limitations are acceptable at launch?

20. Delivery and AI Build Instructions

Fill in each response

What files, documentation, deployment steps, environment variables, and sample data must be delivered?

What should the coding AI never change without approval?

What assumptions should the coding AI surface before building?

How should incomplete integrations or placeholder data be labeled?

Who approves the final build?

Build a complete, responsive application from the completed planning questionnaire. Before coding, produce: (1) a concise requirements summary, (2) user roles and permission matrix, (3) feature-priority list, (4) screen and navigation map, (5) database schema, (6) integration plan, (7) implementation sequence, and (8) contradictions, assumptions, or missing dependencies. Do not silently invent requirements.

During development, use reusable components, a clean folder structure, environment variables for secrets, server-side authorization, frontend and backend validation, accessible interfaces, responsive layouts, and clear loading, empty, success, and error states. Every visible button, menu item, form, and control must work. Do not create fake integrations or unlabeled mock data. Protect restricted data on the server, not only in the interface.

At completion, test every role and must-have workflow. Deliver setup instructions, deployment instructions, environment-variable requirements, database migrations, sample data, test accounts, a completed-feature checklist, known limitations, unfinished items, and recommended future improvements.
